

Technology Stack

Date	04 July 2026
Team ID	
Project Name	A Comprehensive Measure of Well-Being
Maximum Marks	2 Marks

Define Your Technology Stack:

Identify the programming languages, frameworks, databases, front-end tools, back-end tools, and APIs that you will use to build your solution. A well-chosen technology stack ensures that your application is scalable, maintainable, and aligned with your project requirements.

Fill out the table below to detail the specific technologies chosen for each component of your architecture and provide a brief justification for your choice.

S. No	Architecture Component / Layer	Technology Chosen	Justification / Purpose
1	Frontend / Client-Side	HTML, CSS, Bootstrap	To create a simple, responsive, and user-friendly web interface.

2	Backend / Server-Side	Python, Flask	Flask is a lightweight framework that connects the web interface with the machine learning model and provides fast processing.
3	Database / Data Storage	CSV Dataset(hdi.csv)	The project uses a CSV file to store and access HDI data. It is simple, lightweight, and suitable for machine learning projects.
4	Cloud / Hosting / Deployment	Flask Local server/ Render	Used to deploy and test the application. Render provides easy and cost-effective cloud hosting, while Flask Local Server is useful for development and testing.
5	Version Control & CI/CD	Git & GitHub	Git is used to track code changes and manage different versions of the project. GitHub provides online code storage, collaboration, backup, and supports continuous integration and deployment workflows.
